

Detect and monitor confidential information to reduce risk and improve compliance

Reduces security risks

Improves compliance with security and privacy regulations

Empowers your security, risk and compliance professionals

Generates awareness and improves policy compliance

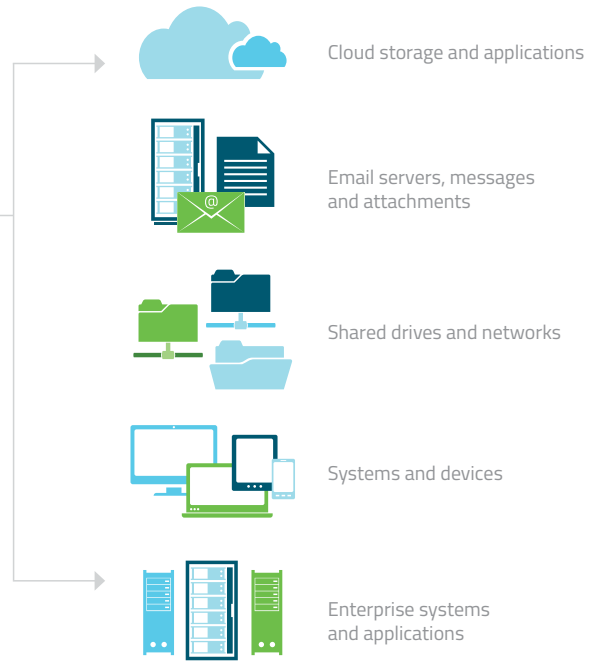

Modern organizations rely on countless systems, applications and devices to power their business processes. This technologically diverse environment makes protecting sensitive information more challenging than ever. When confidential information ends up in unintended places, it creates significant security and compliance risks for the organization.

Hyland's confidential information discovery solution powered by Enterprise Search helps proactively monitor for and remove confidential information from unauthorized locations across your organization, reducing unnecessary security risk and improving compliance with industry and regulatory requirements.

Confidential Information Discovery

- Automated monitoring and alerts
- Scan hundreds of file formats
- Configurable rules for multiple departments

Reduces security risks

When a breach or unintentional disclosure of information occurs, the first concern of the affected organization is to determine if any sensitive information was exposed. Whether it is confidential corporate communication or Personally Identifiable Information (PII), disclosure of confidential information can be costly, resulting in fines, law suits and extensive remediation costs.

With so many systems and devices involved in an organization's day-to-day business, it is all too common for confidential information to end up in unintended places, outside the mandated security and access protocols. Unfortunately, many organizations today struggle with knowing every place where their confidential information resides.

The confidential information discovery solution helps close this knowledge gap and identify every place where confidential information resides so it can be adequately protected or moved to an approved location. The solution can proactively monitor for keywords, phrases and even character patterns in the files and metadata across any number of sites, repositories, drives, archives, email systems (including attachments) and devices.

Improves compliance with security and privacy regulations

Today's organizations are subject to numerous regulatory compliance requirements for information security and privacy, dictating how and where information should be stored, accessed and shared. Additionally, modern regulations like GDPR impose strict requirements on prompt data breach notifications to the affected parties. Not knowing what confidential information exists and where can unnecessarily compound the crisis when a breach occurs or a device is lost, leading to unanticipated regulatory violations and extended reporting and remediation times.

By helping identify and eliminate the presence of confidential information on unauthorized drives, devices and systems, the confidential information discovery solution helps reduce the risk of being non-compliant.

The flexible rules engine also allows the solution to be deployed across multiple departments like HR, contracts and marketing, each with unique target systems and search requirements.

Empowers your security, risk and compliance professionals

The confidential information discovery solution provides your security and compliance professionals with a powerful and intuitive administrative interface, allowing them to set up new queries and alerts with ease. With automated monitoring across a range of systems, your staff will receive notifications when sensitive information is found in unauthorized locations.

The solution also features extensive file analytics and reporting capabilities to help support and simplify your eDiscovery, auditing and other information request processes.

Generates awareness and improves policy compliance

As most security professionals know, people are usually the weakest link in the organization's security program. Your employees generally don't intend to do harm – they just want to do their jobs well. Most of them are not information security experts, and many don't take the time to read and comprehend complex security and privacy policies. They assume that IT is keeping the information secure inside their organization. They may not think twice about attaching a confidential file to an unencrypted internal email, or sharing this file on an internal public drive, or downloading this file to a mobile device so they can work on it at home. Common security tools can't effectively monitor for and prevent such risky behavior.

However, the confidential information discovery solution helps detect when sensitive information shows up in unauthorized places. Being able to detect and follow up on risky behavior is critical in helping generate awareness and improve policy adherence among your employees. Helping your staff become more security-aware will in turn help your organization become more secure and compliant.
